

Business Insights

1. Low Stock Products

The dashboard identifies products whose current stock is at or below their reorder level. These products require attention because insufficient stock may lead to stockouts and missed sales opportunities.

Key observation: Products with low stock and high sales demand should be prioritized for replenishment.

2. Top-Selling Products

The analysis identifies the products with the highest number of units sold. These products represent the strongest demand in the business.

Key observation: High-demand products should be monitored regularly to ensure that inventory levels are sufficient to meet customer demand.

3. Inventory by Category

The dashboard compares current inventory levels across different product categories.

Key observation: Categories with high inventory should be compared with their sales performance to identify possible overstocking, while categories with low inventory and high demand may require faster replenishment.

4. Supplier Purchase Value

Supplier analysis shows which suppliers contribute the highest purchase value.

Key observation: Suppliers with a large share of total purchase value are important procurement relationships and should be monitored for pricing, supply reliability, and purchasing requirements.

5. Inventory Value

Stock Value measures the amount of money currently invested in the available inventory.

Key observation: Monitoring inventory value helps the business understand how much capital is tied up in stock and supports better purchasing and inventory-control decisions.

6. Inventory Movement

Stock Turnover indicates how efficiently inventory is being converted into sales over the selected period.

Key observation: Products or categories with relatively low turnover may require further investigation for slow-moving inventory, while faster-moving inventory may require more frequent replenishment.

7. Stock Coverage

Stock Coverage Days estimates how many days the current inventory can support sales based on the average daily sales rate.

Key observation: Products with very low coverage days may face replenishment risk, while products with very high coverage days may require investigation for slow movement or excess inventory.

Overall Business Insight

The dashboard provides a consolidated view of **inventory, sales, purchases, suppliers, and stock movement**. By combining low-stock analysis with sales demand, inventory value, turnover, and stock coverage, the business can identify replenishment priorities, monitor inventory investment, and improve inventory-management decisions.

Key Areas for Management Attention

- **Low Stock + High Sales** → High replenishment priority
- **High Stock + Low Sales** → Possible slow-moving inventory
- **High Purchase Value** → Important supplier relationship
- **High Stock Value** → More capital tied up in inventory
- **Low Stock Coverage** → Potential stockout risk
- **Low Stock Turnover** → Investigate slow inventory movement
- **High Sales Products** → Maintain sufficient stock availability
